X.509 证书描述

在密码学中, X.509 是公钥证书的格式标准, 在许多互联网协议中得到应用。

X.509 对公钥证书的格式, 撤销证书列表 (CRLs), 证书验证路径算法等进行了规定。

一个 X.509 证书中包含了其版本号, 证书序列号, 签名算法, 签发者, 证书主体, 有效期, 公钥, 公钥密钥等信息。证书中的信息使用 ASN.1 进行编码, ASN.1 中数据以 tag, 长度, 值的方式进行编码。证书的基本结构在 RFC 5280 中 4.1 节进行了如下的规定:

```
Certificate ::= SEQUENCE {
    tbsCertificate      TBSCertificate,
    signatureAlgorithm  AlgorithmIdentifier,
    signatureValue      BIT STRING }
(证书主体, 签名算法以及签名值)
```

```
TBSCertificate ::= SEQUENCE {
    version             [0] EXPLICIT Version DEFAULT v1,
    serialNumber        CertificateSerialNumber,
    signature           AlgorithmIdentifier,
    issuer              Name,
    validity            Validity,
    subject             Name,
    subjectPublicKeyInfo SubjectPublicKeyInfo,
    issuerUniqueID      [1] IMPLICIT UniqueIdentifier OPTIONAL,
                        -- If present, version MUST be v2 or v3
    subjectUniqueID     [2] IMPLICIT UniqueIdentifier OPTIONAL,
                        -- If present, version MUST be v2 or v3
```

```

extensions      [3] EXPLICIT Extensions OPTIONAL
                -- If present, version MUST be v3
    }

```

(证书主体, 包含版本号, 序列号, 签名算法标识, 签发者信息, 有效期, 证书主体, 证书公钥信息, 签发者 ID, 主体 ID 以及扩展段)

```

Version ::= INTEGER { v1(0), v2(1), v3(2) }

```

(证书版本, 值可为 0, 1, 2, 分别代表版本 1, 2, 3)

```

CertificateSerialNumber ::= INTEGER

```

(证书序列号)

```

Validity ::= SEQUENCE {
    notBefore      Time,
    notAfter       Time }

```

(证书有效期, 由开始和结束时间组成)

```

Time ::= CHOICE {
    utcTime        UTCTime,
    generalTime    GeneralizedTime }

```

```

UniqueIdentifier ::= BIT STRING

```

```

SubjectPublicKeyInfo ::= SEQUENCE {
    algorithm        AlgorithmIdentifier,
    subjectPublicKey  BIT STRING }

```

(公钥信息包含公钥算法和公钥数据)

```

Extensions ::= SEQUENCE SIZE (1..MAX) OF Extension

```

```

Extension ::= SEQUENCE {
    extnID      OBJECT IDENTIFIER,
    critical    BOOLEAN DEFAULT FALSE,
    extnValue   OCTET STRING
                -- contains the DER encoding of an ASN.1 value
                -- corresponding to the extension type identified
                -- by extnID
    }

```

```

AlgorithmIdentifier ::= SEQUENCE {
    algorithm      OBJECT IDENTIFIER,
    parameters    ANY DEFINED BY algorithm OPTIONAL }

```

读取 X.509 证书

提交的程序中使用 Go 语言编写读取 X.509 的程序，调用了 Go 语言的 `encoding/asn1` 库进行 ASN.1 编码内容的读取以及 `crypto/x509/pkix` 库进行对签发者与证书主体信息的读取。

在代码中根据上面的 X.509 证书结构定义了如下的结构体用于 ASN.1 读取：

1. CertificateData，对应上述结构中的 Certificate：

```
type CertificateData struct {
    TBSCertificate      tbsCertificate
    SignatureAlgorithm AlgorithmIdentifier
    SignatureValue       asn1.BitString
}
```

2. TbsCertificate，对应上述结构中的 TBSCertificate：

```
type tbsCertificate struct {
    Version          int
    `asn1:"optional,explicit,default:0,tag:0"`
    SerialNumber      *big.Int
    Signature          AlgorithmIdentifier
    Issuer             asn1.RawValue
    Validity           timeSpan
    Subject            asn1.RawValue
    PublicKey          publicKeyInfo
    UniqueId           asn1.BitString `asn1:"optional,tag:1"`
    SubjectUniqueId    asn1.BitString `asn1:"optional,tag:2"`
    Extensions         []extension
    `asn1:"optional,explicit,tag:3"`
}
```

3. timeSpan，对应上述结构的 Validity：

```
type timeSpan struct {
```

```

    NotBefore, NotAfter time.Time
}

```

4. publicKeyInfo, 对应上述的 SubjectPublicKeyInfo:

```

type publicKeyInfo struct {
    Algorithm AlgorithmIdentifier
    PublicKey asn1.BitString
}

```

5. extension, 对应上述结构的 Extension

```

type extension struct {
    ExtnID      asn1.ObjectIdentifier
    Critical    bool `asn1:"default:false"`
    ExtnValue []byte
}

```

6. AlgorithmIdentifier, 对应上述的 AlgorithmIdentifier:

```

type AlgorithmIdentifier struct {
    Algorithm asn1.ObjectIdentifier
    Parameters asn1.RawValue `asn1:"optional"`
}

```

程序结构简述

提交的代码中包含三个代码文件: x509cert/certificate.go 为证书结构体的定义以及对证书中算法的识别函数, 并定义了如下的 certInfo 结构方便其他代码获取证书信息:

```

type CertInfo struct {
    Version          int
    Serial           *big.Int
    Signature        AlgorithmIdentifier
    Issuer           IssuerType
    Validity         timeSpan
    Subject          IssuerType
}

```

```

        PublicKey          publicKeyInfo
        UniqueId            asn1.BitString
        SubjectUniqueId     asn1.BitString
        Extensions          []extension
        SignatureAlgorithm  AlgorithmIdentifier
        SignatureValue       asn1.BitString
    }

    type IssuerType struct {
        Country      string
        Province     string
        City         string
        Organization string
        Unit         string
    }

```

x509cert/static.go 文件包含了证书读取过程中的一些静态数据如算法的名称与 oid 等。

main.go 文件包含程序的主函数，将根据 pem 格式或 DER 格式读取文件并将证书信息打印至标准输出。

程序编译运行结果

程序使用 go 进行编译，在代码目录下执行命令 `go build -o x509` 即可编译生成命名为 x509 的可执行文件。提交的 bin 文件夹中已包含了使用 go1.11.1 编译获得的 Windows, MacOS 以及 Linux 下的可执行文件。

程序的使用方法为：

```
./x509 [--DER] filename
```

其中若指定了 DER 选项，则程序将会使用 DER 方式读取证书，若未指定则程序会使用 PEM 方式读取证书。

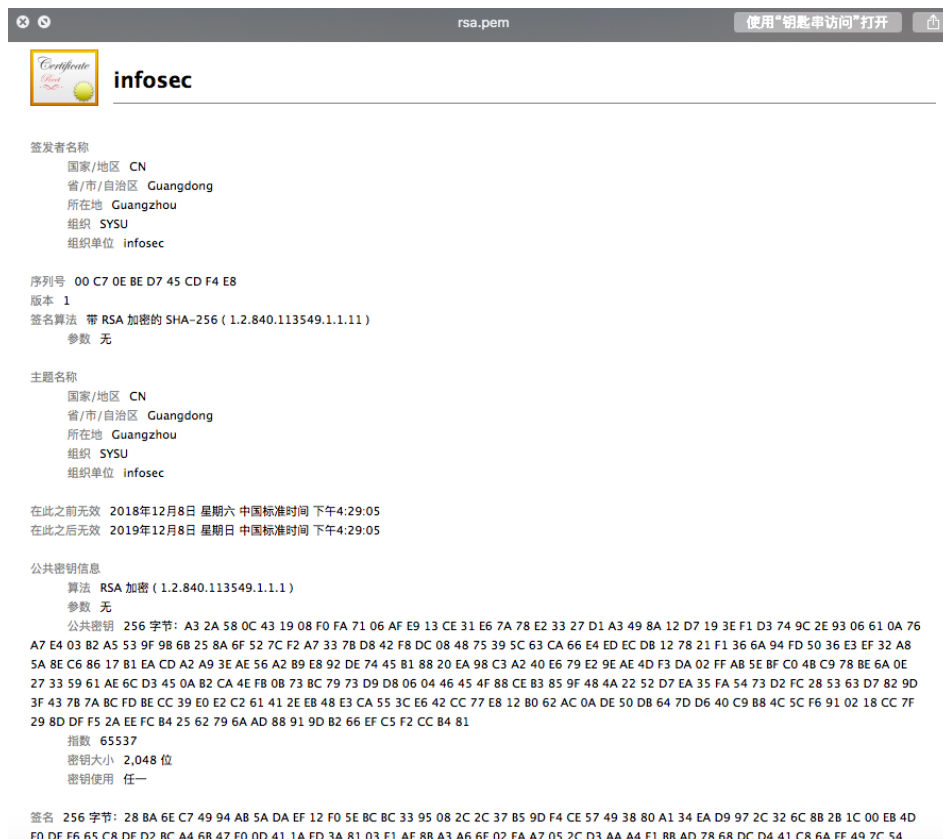

测试运行使用的证书使用 openssl 生成自签名根证书，命令如下：

```
openssl req -new -x509 -days 365 -keyout rsa.key -out rsa.pem
```

命令执行后需要输入证书主体信息：

```
~/Desktop/大三上/web-security/hw/infosec/x509/cert  master  openssl req -new -x509 -days 365 -keyout rsa.key -out rsa.pem
Generating a 2048 bit RSA private key
.....+++
.....+++
writing new private key to 'rsa.key'
Enter PEM pass phrase:
Verifying - Enter PEM pass phrase:
-----
You are about to be asked to enter information that will be incorporated
into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank
For some fields there will be a default value,
If you enter '.', the field will be left blank.
-----
Country Name (2 letter code) []:CN
State or Province Name (full name) []:Guangdong
Locality Name (eg, city) []:Guangzhou
Organization Name (eg, company) []:SYSU
Organizational Unit Name (eg, section) []:infosec
Common Name (eg, fully qualified host name) []:
Email Address []:
```

使用该命令会使用 RSA 算法签名生成有效期为 365 天的根证书，使用系统自带证书工具查看证书信息如下：

使用如下命令将上面命令生成的 pem 证书转换为 DER 证书进行测试：

```
openssl x509 -in rsa.pem -outform der -out rsa.crt
```

转换后生成 rsa.crt 证书文件，查看结果与原证书相同。

使用如下命令生成 ECDSA 签名算法的证书用于测试：

```
openssl ecparam -name secp256k1 -genkey -param_enc explicit -out ecparam.pem
```

```
openssl req -new -x509 -key ecparam.pem -out ec.pem -days 365
```

输入证书主体信息后生成证书：

```
~/Desktop/大三上/web-security/hw/infosec/x509/cert > master • openssl req -new -x509 -key ecparam.pem -out ec.pem -days 365
You are about to be asked to enter information that will be incorporated
into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank
For some fields there will be a default value,
If you enter '.', the field will be left blank.
-----
Country Name (2 letter code) []:CN
State or Province Name (full name) []:Guangdong
Locality Name (eg, city) []:Guangzhou
Organization Name (eg, company) []:Sun Yat-sen University
Organizational Unit Name (eg, section) []:Web Security
Common Name (eg, fully qualified host name) []:
Email Address []:
```

使用编写的程序在证书目录下执行的效果如图：

1. rsa.pem

```
./../bin/x509-darwin-amd64 rsa.pem
```

```
~/Desktop/大三上/web-security/hw/infosec/x509/cert > master • ./../bin/x509-darwin-amd64 rsa.pem
Version: 1

```

程序显示内容为证书的版本号，序列号，签名算法，签发者，主体，有效期，

公钥信息，RSA 公钥数据以及证书签名，与系统工具显示的证书内容相同。

2. 使用 DER 证书文件进行读取的结果如图：

```

~/Desktop/大三上/web-security/hw/infosec/x509/cert  master • ../../bin/x509-darw
in-amd64 --DER rsa.crt
Version: 1
Serial Number: 14343611695019980008(C70EBED745CDF4E8)
